

Enhanced LaserJet Printing®

simple but powerful paper-handling and forms functionality

Enhanced LaserJet Printing adds easy access to sophisticated paper-handling and forms functionality to your HP LaserJet printer.

Even now, when most of your printed output is of a high quality, do you still find certain processes require large and loud matrix printers, printing on expensive carbon sets, producing inflexible output of questionable legibility? Do you wish there might was an easy way to get automatic multiple copies out of your HP LaserJet printer, with all of the quality, convenience, reliability and cost savings that modern printing technology can offer?

Enhanced LaserJet Printing (ELP) gives you control over the quantity and execution of automatic copies, with sophisticated forms potential. At its simplest this could mean printing an automatic copy of a letter from Word on plain paper. But it could also mean automatically printing department-specific copies of electronic forms, color-coded for easy sorting from a single printout from your bookkeeping application – without complex programming!

How ELP works

The ELP Module inserted into your HP LaserJet printer like any other memory extension. Using text-sequences you can select paper-trays and output-bins, define the quantities of copies and pick and combine pre-saved data and macros to format your printout – all from the comfort of your existing applications.

The ELP Modul also has memory to store forms, fonts, signatures, logos and graphics, data that is maintained even when the printer is turned off. The data can be managed from any computer with access to the printer – the easiest way is to use the Forms and Font Manager™ (described in its own datasheet).

characteristics

- ELP Modul is inserted into your HP LaserJet printer like any other memory extension
- text-sequences embedded in the document allow you to select papertrays and output-bins, define the quantities of copies and pick and combine pre-saved data and macros to format your printout
- memory for storing forms, fonts, signatures, logos and graphics

areas of application

- any environment where multiple copies are required directly from the application
- wherever special forms output is required with predefined layout and formatting

special features

works particularly well with Forms and Fonts Manager
